

WALLET-FRIENDLY 3-SD CARD HOLDER

INSTRUCTIONS

1. Download this PDF from this short URL: <http://w.undr.us/walletsd> and print on a colorful sheet of 8.5"x11" 60 lb. copier paper.
2. Cut the page into quarters, along the solid lines on the print. Keep this instruction quarter aside for reference - then pass it on to friends so they can make their own!
3. Fold each SD card holder quarter in half, along the dotted line. With the black side facing up cut out the black area using good scissors or an xacto blade ensuring you cut through both sides of the paper. You should end up with 3 folded slips of paper, all shaped like the illustration to the right.
4. Lamininate the resulting pieces of paper, making sure they remain folded, keeping 1/2" minimum distance from each other or the sides. Run it through the laminator twice, to ensure a good seal. You want to see the lamination touch itself in the channels we cut, and all along the outside of the paper.
5. Cut each slip out of the laminate along the dashed lines. Make 2 straight cuts along the dashed lines first. Then trim the ends just beyond the laminate seal to credit card size (3 3/8"), and finally cut out the three tabs.
6. You should be able to slide three full sized SD Cards into each holder, then into your wallet. Friction should be enough to keep the cards in your wallet under most circumstances, but YMMV.
7. You can write your return contact info in the empty section available before you laminate, in case some kind soul would actually return your lost SD Cards and not reformat and use them instead.
